

SETUP GUIDE · V1.0.0

# Tatanka Indicators

TradingView & NinjaTrader 8

October 2026 · [tatankatrading.com](https://tatankatrading.com)

WHAT YOU GET

## Four free indicators

All four are free and open source (v1.0.0) on TradingView and NinjaTrader 8. Your \$20 membership covers the daily levels, the Globex levels and the afternoon review plans you load into them.

| INDICATOR           | WHAT IT DOES                                                                                                                     | GET IT                      |                             |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-----------------------------|
| Tatanka AMT Toolkit | The main chart: volume profiles, initial balance, overnight inventory, naked POCs, single prints, day type and your daily levels | <a href="#">TradingView</a> | <a href="#">NinjaTrader</a> |
| TPO Profile         | 30-minute TPO letters with POC and value area                                                                                    | <a href="#">TradingView</a> | <a href="#">NinjaTrader</a> |
| If/Then             | The afternoon review's if/then plan as a live table on the chart                                                                 | <a href="#">TradingView</a> | <a href="#">NinjaTrader</a> |
| 1hr 21 EMA          | The 1-hour 21 EMA on any chart timeframe                                                                                         | <a href="#">TradingView</a> | <a href="#">NinjaTrader</a> |

All four NinjaTrader indicators come in one zip: [TatankaAll\\_NT8.zip](#). Screenshots of each are at [tatankatrading.com/indicators](https://tatankatrading.com/indicators).

# TradingView

On TradingView the indicators are public scripts: add them once and they update on their own. They run on the free TradingView plan.

## 1 Add the indicators

- 1 Open a script page from the table on page 1 and click **Add to favorites**.
- 2 On your chart, open **Indicators** (or press **/**), go to **Favorites** and click the script.
- 3 Repeat for each indicator you want. The Toolkit shows on the chart as **Tatanka AMT**.

**Coming from the old invite-only script?** Remove it from your chart first. Settings don't carry over, so set your colors and toggles again on the new one.

## 2 Set up the chart

| SETTING              | VALUE                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Symbol</b>        | ES1!, NQ1!, CL1!, GC1! or their micros                                                                                                                                       |
| <b>Timeframe</b>     | A minute chart, such as 5 or 15 minutes                                                                                                                                      |
| <b>Session times</b> | Leave every session input at its default. They're CME Central time wherever you live. To see your own time, change the chart's time zone in the bottom-right corner instead. |
| <b>B-ADJ</b>         | Leave it off (the default) so levels sit at the prices that actually traded. The Toolkit follows this setting.                                                               |
| <b>Plan</b>          | The free plan works. It limits how many indicators fit on one chart and how many alerts can be active.                                                                       |

### 3 Load the daily levels

Each levels post in Discord ends with that symbol's paste line:

```
2026-10-05, 7745.25, 7758.25, 7772.00, 7786.50, 7801.25, 7818.00, 7730.25, 7718.25, 7707.25,
7690.50, 7672.75
```

■ Date ■ Pivot ■ Resistance (above the pivot) ■ Support (below the pivot)

- 1 Copy the line for your chart's symbol.
- 2 Double-click the Toolkit on the chart (or click its gear icon) to open its settings.
- 3 Under **2. Daily Levels**, paste the line into **Paste Levels Here** and click **OK**.

Load the 4:45 PM CT Globex levels the same way. A new paste replaces the old one.

### 4 Load the If/Then block

- 1 Copy the whole If/Then block for your chart's symbol from the afternoon review (ES and NQ each get their own).
- 2 Open the If/Then settings and paste the block into the block input, replacing the old one.
- 3 Click **OK**. The band price is in is highlighted, and the table updates as price moves between bands.

### 5 Alerts

- 1 In the Toolkit settings, turn on the alerts you want. Each section has its own alert switches; level alerts are under **2. Daily Levels → Enable Level Alerts**.
- 2 Open **Create Alert** (Alt + A).
- 3 Set the condition to **Tatanka AMT**, then **Any alert() function call**, and click **Create**.

One alert covers every alert you switched on.

**New levels need a new alert.** A TradingView alert keeps the levels it was created with. After pasting new levels, delete the alert and create it again.

### 6 Updates

TradingView updates the scripts for you. The dashboard header shows the version (v1.0.0). If it still shows an old version after you reload the page, remove the indicator and add it again from Favorites.

# NinjaTrader 8

On NinjaTrader each indicator is a zip you import once. There's no auto-update, so new versions are imported the same way.

## 1 Import the indicators

- 1 Download the zip from the table on page 1. **Don't unzip it.**
- 2 In the Control Center, go to **Tools → Import → NinjaScript Add-On**, pick the zip and confirm. NinjaTrader compiles it and says the import succeeded.
- 3 On a chart, right-click → **Indicators**, double-click the indicator, then click **OK**.

In the Indicators list they're named **Tatanka AMT Toolkit**, **TPO Profile**, **If/Then Bias Table** and **HTF EMA (1H 21 by default)**. The Toolkit's first load can take a minute while it pulls 1-minute, 30-minute and daily history.

## 2 Set up the chart

| SETTING              | VALUE                           | WHERE                                          |
|----------------------|---------------------------------|------------------------------------------------|
| <b>Bars</b>          | Minute, such as 5 or 15 minute  | Chart → Data Series → Type / Value             |
| <b>Trading hours</b> | ETH                             | Data Series → Trading hours                    |
| <b>Days to load</b>  | 90 (400 for the yearly profile) | Data Series → Load data based on               |
| <b>Tick Replay</b>   | Off                             | Data Series                                    |
| <b>Merge policy</b>  | Merge non back adjusted         | Control Center → Tools → Options → Market Data |

**Session times.** Leave the Toolkit's session times at their defaults; they're CME Central time wherever you live. The TPO Profile is the exception: its session time follows your chart's time zone (0830-1500 for Central, 0930-1600 for Eastern).

**Tip:** once the chart looks right, save it as a template: right-click the chart → **Templates → Save As**.

### 3 Load the daily levels

- 1 Copy the paste line for your chart's symbol from the levels post.
- 2 Open the Toolkit's settings (right-click the chart → **Indicators** → **Tatanka AMT Toolkit**).
- 3 Under **2. Daily Levels**, paste the line into **Paste Levels Here** and click **OK**.

Load the Globex levels the same way. Copying the whole Discord post works too; titles and formatting are skipped. Two checks protect you:

- **STALE LEVELS** shows when the line's date is older than the chart's trading date.
- A line far from the chart's price is rejected, with the reason on the chart. That's usually another symbol's levels, or a price written with a comma (7,745.25).

### 4 Load the If/Then block

- 1 Copy the whole If/Then block for your chart's symbol from the afternoon review.
- 2 In the If/Then Bias Table settings, click **Rows** under **3. If/Then block**. NinjaTrader opens a multi-line editor.
- 3 Replace the old block with the new one and click **OK**.

### 5 Alerts

- Each section of the Toolkit has its own alert switches. Level alerts are under **2. Daily Levels** → **Enable Level Alerts**.
- **18. Alerts** → **Level Alert Mode** fires on a cross, on entering the zone around a level, or both.
- Alerts show in the **Alerts Log** window. Turn them on for one chart per instrument, or every alert fires twice.
- Phone alerts (optional): **19. Discord Alerts** sends Toolkit alerts to your own Discord server. In your server, go to **Server Settings** → **Integrations** → **Webhooks** → **New Webhook**, copy the webhook URL and paste it into **Discord Webhook URL**.

### 6 Updates

When a new version is posted in the changelog channel:

- 1 Download the zip from the same link.
- 2 Import it the same way and accept the overwrite.
- 3 Reload the chart (F5). Your settings are kept.

The dashboard header shows your version (**Tatanka AMT v1.0.0**).

# Troubleshooting

Most problems come from the levels line, the chart's history or another script on your PC.

| PROBLEM                                            | PLATFORM    | FIX                                                                                                                                                                                                                   |
|----------------------------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Slow, or the script times out                      | Both        | Set <b>1. Global Settings → Profile Row Scale</b> higher (for example 10x), or use a shorter profile period.                                                                                                          |
| Red warning about session times                    | Both        | A session input was changed. Reset it to its default.                                                                                                                                                                 |
| Levels don't draw                                  | TradingView | Check the line: date first, then prices, comma-separated, with no commas inside a price.                                                                                                                              |
| Level alerts fire on yesterday's levels            | TradingView | Delete the alert and create it again after pasting new levels.                                                                                                                                                        |
| "Too many indicators"                              | TradingView | The free plan limits indicators per chart. Remove one or use a second chart.                                                                                                                                          |
| Import fails with compile errors                   | NinjaTrader | Another broken script on your PC is usually the cause, because NinjaTrader compiles every script together. Open <b>New → NinjaScript Editor</b> ; the error list names the file. Fix or remove it, then import again. |
| Red text on the chart, or nothing drawn            | NinjaTrader | Check the <b>Log</b> tab in the Control Center for the indicator's message.                                                                                                                                           |
| "Loading chart and secondary history" never clears | NinjaTrader | Your data feed needs 1-minute and daily history for the symbol. Check the connection and Days to load.                                                                                                                |
| STALE LEVELS                                       | NinjaTrader | The pasted date is older than the chart's trading date. Paste the latest line.                                                                                                                                        |
| Levels rejected                                    | NinjaTrader | The line is for another symbol, or a price has a comma in it.                                                                                                                                                         |
| Alerts fire twice                                  | NinjaTrader | The Toolkit is on two charts of the same instrument with alerts on. Turn alerts off on one.                                                                                                                           |

Ask in the **Discord** with a screenshot, your platform and the version from the dashboard header.

The full guides, with every setting explained, are on GitHub: [tatankatrading.com/github](https://github.com/tatankatrading).

*Trading futures involves substantial risk of loss. These indicators are analysis tools, not buy/sell signals or trade recommendations.*
